Background: Liver fibrosis and HFmrEF/HFpEF

- Liver fibrosis is thought to be a potentially common comorbidity in heart failure (HF), driven by hepatic venous congestion and hypoperfusion, systemic inflammation, and metabolic disturbances.
- The fibrosis-4 (FIB-4) index is an established non-invasive score used to predict the likelihood of liver fibrosis.

$$\text{FIB-4} = \text{Age [years]} \times \text{AST [U/L]} \div (\text{PLT [10}^9\text{/L]} \times \sqrt{\text{ALT[U/L]}})$$

- The prognostic value of the FIB-4 index in patients with HF and mildly reduced or preserved ejection fraction (HFmrEF/HFpEF) is uncertain. We examined the FIB-4 index in the FINEARTS-HF trial.

FINEARTS-HF Study Design

Prospective, randomized, double-blind, placebo-controlled trial comparing finerenone to placebo in patients with heart failure and left ventricular ejection fraction (LVEF) $\geq 40\%$

- Age ≥ 40 years
- NYHA class II-IV
- LVEF $\geq 40\%$
- Hospitalized, recently hospitalized, or ambulatory

Eligibility Criteria

- Structural Heart Disease
- (LVH or LA Enlargement)
- Elevated Natriuretic Peptides
- Diuretics in the 30d prior to randomization

N=6,001

Double-blind treatment period

Finerenone 10, 20, and 40mg dosing based on *eGFR*

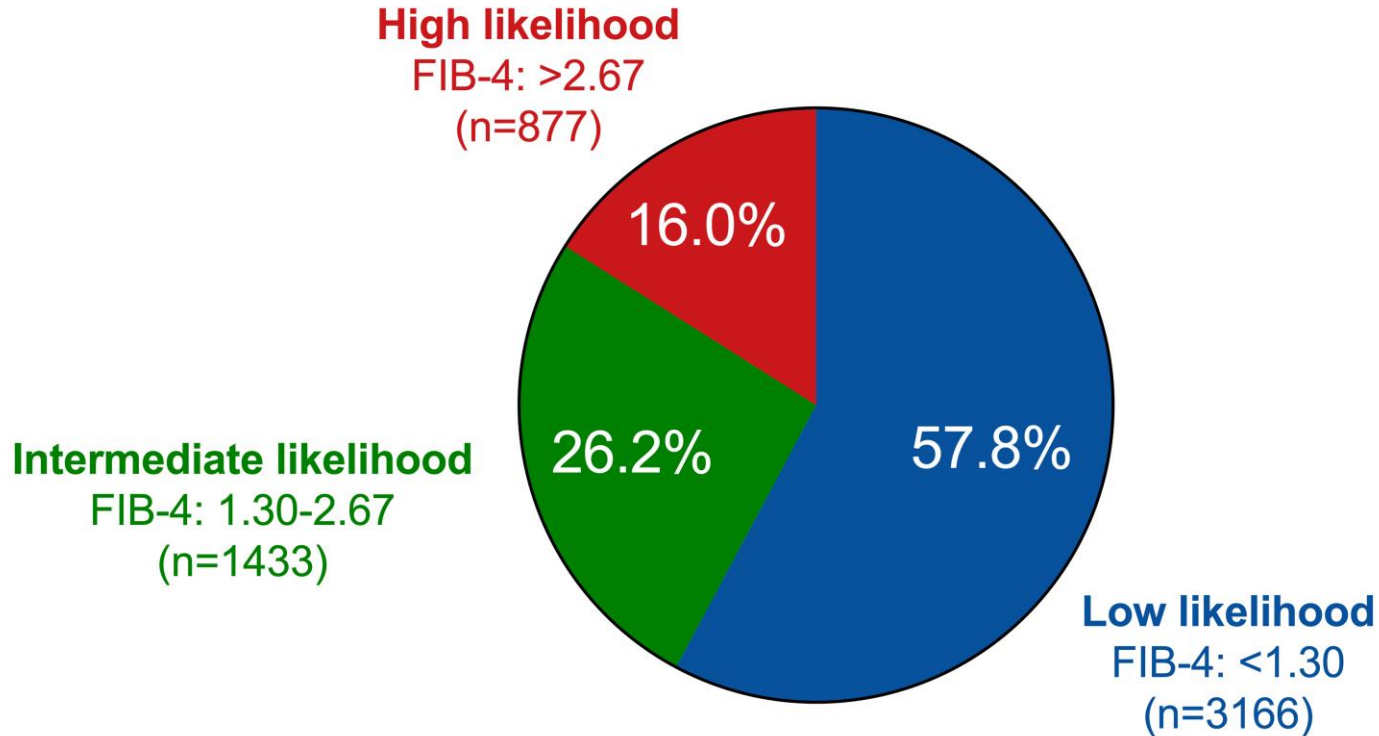

Matching Placebo

Primary outcome:
Total (first and recurrent) HF events or CV death

Visits: Month 1, then 3-monthly for first 12 months, 4-monthly visits thereafter with telephone contact in between

Fibrosis-4 (FIB-4) index in FINEARTS-HF

N = 5476 (91.1%) had FIB-4 index calculable at baseline

Baseline characteristics according to baseline FIB-4 index

	Low likelihood <1.30 (n=3166)	Intermediate likelihood 1.30-2.67 (n=1433)	High likelihood >2.67 (n=877)	P for trend
Age (years), mean	70.4	71.8	77.7	<0.001
Male sex, %	50.7	60.5	59.5	<0.001
SBP (mmHg), mean	129.9	129.1	128.0	0.001
BMI (kg/m ²), mean	30.8	29.5	27.5	<0.001
Atrial fibrillation, %	49.4	56.9	68.8	<0.001
Myocardial infarction, %	26.5	26.8	21.0	0.006
Stroke, %	11.2	11.1	16.1	<0.001
Type 2 diabetes, %	45.6	36.7	32.2	<0.001
KCCQ-TSS, mean	66.2	68.6	69.1	<0.001
NT-proBNP, median	867	1124	1539	<0.001
eGFR (ml/min/1.73 m ²) , mean	63.9	62.6	55.6	<0.001

Baseline characteristics according to baseline FIB-4 index

	Low likelihood <1.30 (n=3166)	Intermediate likelihood 1.30-2.67 (n=1433)	High likelihood >2.67 (n=877)	<i>P</i> for trend
ALT (U/L), mean	19.8	21.0	22.5	<i>0.040</i>
AST (U/L), mean	19.6	24.5	31.9	<i><0.001</i>
ALT/AST ratio, median	1.1	1.3	1.5	<i><0.001</i>
Hepatic steatosis index, median	39.9	37.0	34.0	<i><0.001</i>
MELD-XI score, median	10.1	10.6	11.5	<i><0.001</i>
APRI, median	0.2	0.3	0.5	<i><0.001</i>
BARD score 2-4, %	89.9	95.0	97.6	<i><0.001</i>
Loop diuretic, %	86.1	88.4	90.6	<i><0.001</i>
Beta-blocker, %	85.7	86.3	81.2	<i>0.008</i>

ARB, %	45.6	41.0	40.8	<i>0.002</i>

Cumulative incidence of clinical outcomes according to baseline FIB-4 index

Total HF events and CV death

No. at risk				
<1.30	3166	2971	2311	901
1.30-2.67	1433	1354	1070	413
>2.67	877	802	626	258

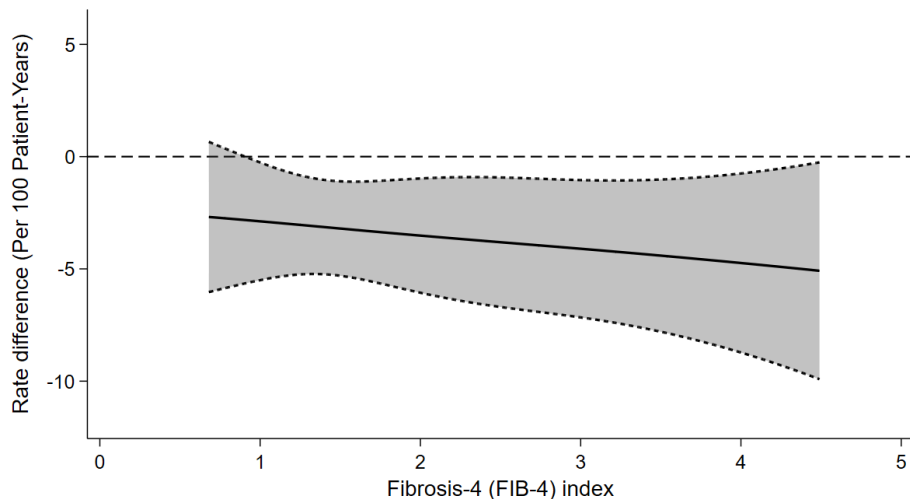

All-cause death

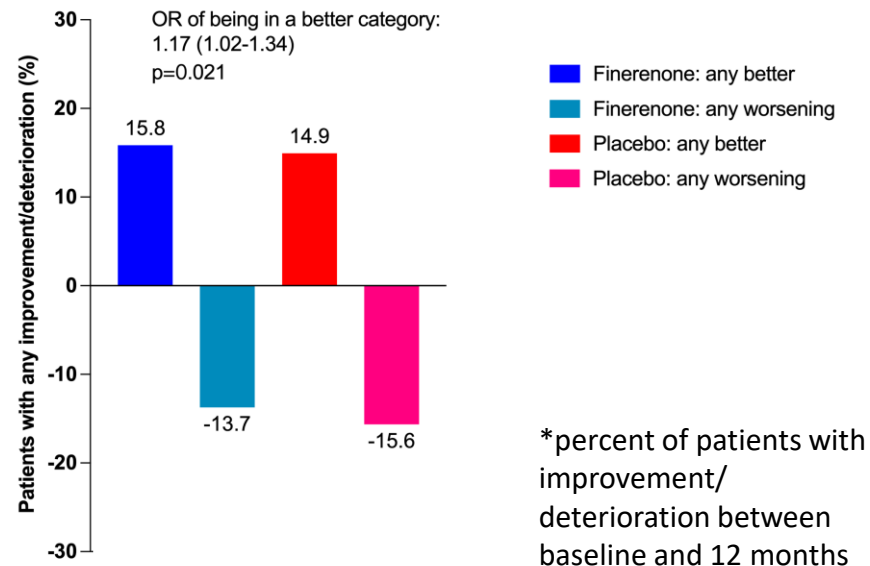

No. at risk				
<1.30	3166	2986	2325	906
1.30-2.67	1433	1357	1079	419
>2.67	877	803	629	261

Effect of finerenone versus placebo on the primary endpoint according to FIB-4 index (and on FIB-4 index)

Total heart failure events and CV death

Percent patients with improvement or deterioration in FIB-4 category*

Conclusions: Finerenone and FIB-4 index in patients with HFmrEF/HFpEF

- In FINEARTS-HF, about 1 in 6 patients had a high FIB-4 score indicating a high likelihood of liver fibrosis (although this remains to be confirmed in heart failure).
- FIB-4 score independently predicted the risk of clinical outcomes in HFmrEF/HFpEF.
- Finerenone consistently reduced the primary outcome in FINEARTS-HF across the range of FIB-4 index at baseline.
- In addition, treatment with finerenone improved FIB-4 index between baseline and 12 months.
